

1 **ABSTRACT**

2       In an implementation of component localization, control components are  
3 maintained that each define a localization format, such as a display format for a  
4 section of a display. A locale designation is received and a control component is  
5 obtained that corresponds to a locale. Display data is generated that includes the  
6 control component in a display format defined by the control component and  
7 which corresponds to the designated locale according the defined localization  
8 format.
